Choosing The Right Location

Your Hydropool Swim Spa can be installed indoors or out, on the ground, in the ground or half-and-half. The following information will assist you in choosing the right location for your individual needs. When making your decision, always remember that Swim Spas can be enjoyed year-round, indoors or out, regardless of the climate. Many Hydropool owners report that their favorite time to use a Swim Spa is in the cooler fall and winter months, while others praise the enjoyment of using their Swim Spa in the warmer spring and summer months.

Here are a number of suggestions that we cover in the following pages...

- 1) Edge of Deck Installations
- 2) In Ground Installations
- 3) Half and Half Installations
- 4) Stand Alone Installations
- 5) Raised Deck Installations
- 6) Sunroom Or Indoor Installation

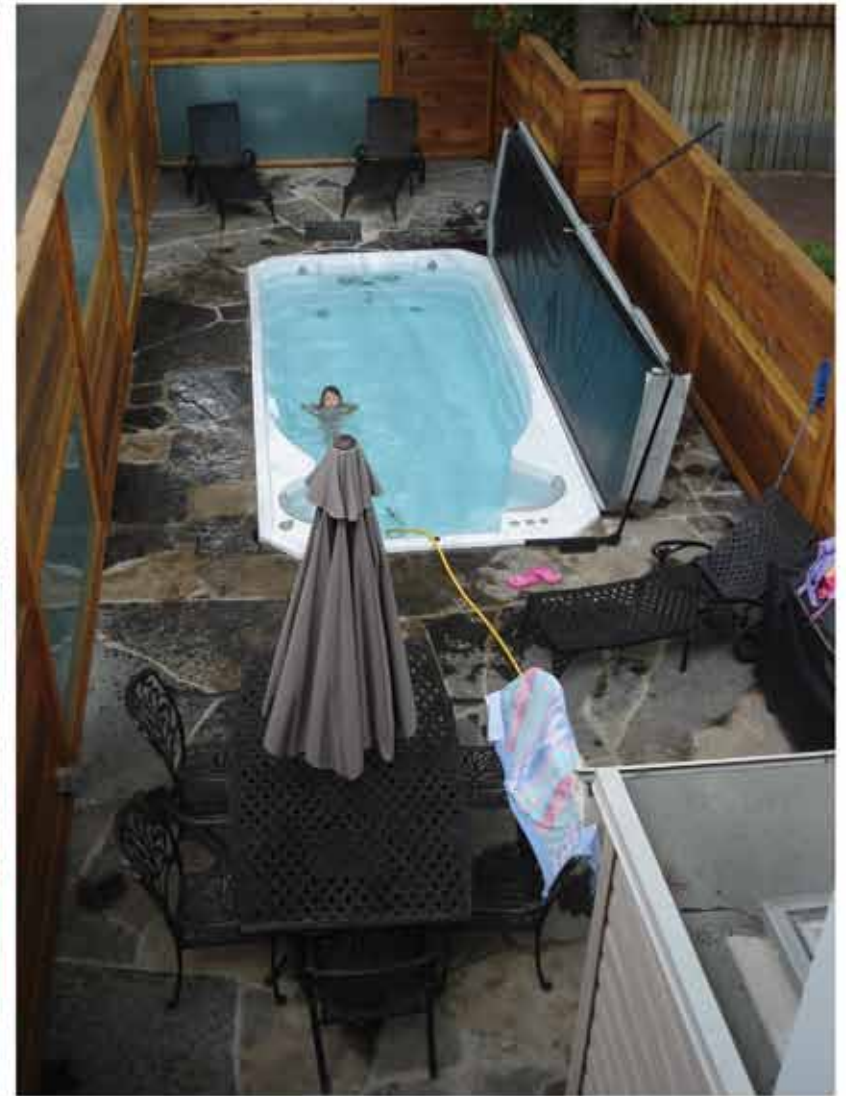

1) Edge of Deck Installations

Edge of Deck Installations: This is one of the most popular installations types in the world for one reason, most people are planning to add a deck to their backyard at one point or another! This type of installation gives you the best of all worlds, because it has the beauty and aesthetics of a raised deck installation but with the service access of a stand alone installation.

2) In Ground Installations

Inground Installations: This is one of the most detailed installations for any Swim Spa and has to be well thought out before perusing this endeavour. Here are the major things to consider when doing an in ground installation. The first thing is to make sure the Swim Spa is serviceable on all sides, the second thing is make sure to consider the ground water seepage, this will be the lowest part of the backyard so make the pit is able to handle the water flow and finally consider the rodents and pests, make sure the pit is secure and protected from any unwanted pests that might want to build a home. Despite the extra work, these installations can offer the biggest payoff! Take a look at the pictures and you decide whether it is worth the time and effort. Contact your local retailer for help on the type of install.

3) Half & Half Installations

Half and Half Installations: All of the same precautions and planning is required for this type of installation as if you were doing an in ground or raised deck installation. Half and Half installs can be more work, so be sure to ask for guidance from your Hydropool retailer. They can however be some of the easiest Swim Spas to get into and maintain. The raised lip of edge of these Swim Spas allows you to sit on the side and swing your legs in or simply step over the side from a level surface to a level surface.

4) Stand Alone Installations

Stand Alone Installations: By far the most common installations in the Swim Spa industry, the stand alone install is easy install; no digging, no contractors, no special equipment. It simply cranes into place and its ready to fill with water. These types of installs allow for easy service and installation of any cover lifter. Put in the right place these Swim Spas can really change the look of a backyard!

5) Raised Deck Installations

Raised Deck Installations: Customers who choose a raised deck installation have some of the most beautiful installs in the world. Please make sure there is access on all four sides of the Swim Spa if there is ever a need for service. This type of install also has some troubles when it comes to placement of the hardcover, it is difficult to install a lifter in a full recessed deck due to space restrictions. Although these can be beautiful installations, please make sure to think talk with your retailer about your plans before moving forward.

6) Sun Room or New Room Addition Installations

Sun Room or Indoor Installations: If members of your family are not cold weather enthusiasts, or if your backyard or patio area is not suitable for a Swim Spa installation, then an indoor location for your Swim Spa may be your best or only choice. You may wish to create an exercise/spa area in your home, or install your Swim Spa in a glass solarium or four-season room adjoining your home. Indoor installations not only add a unique look and appeal to your home, they provide the privacy and controlled climate to ensure that use and enjoyment of your Swim Spa is maximized.

Indoor Installation considerations:

- 1) It is beneficial to have the Swim Spa room located near washroom and shower facilities
- 2) The Swim Spa room should have a floor drain to handle splash water, a window, and an outside exhaust fan controlled by a humidistat for ventilation.
- 3) Consider plumbing a water tap and drain location nearby to facilitate draining and top-up.
- 4) Always provide adequate ventilation for the support equipment.
